### Architecture of Grammar, day 2

Uli Sauerland Leibniz-Centre General Linguistics (ZAS), Berlin

University of Buenos Aires, May 14-16, 2025

## Recap from day 1

#### Scorecard:

- structure sensitivity
- phonology insensitivity
- purely syntactic factors, e.g. categories?
- LF/PF parallelism: allosemy?
- universal cartography?

### 'Movement'

Recall: movement/scope argument against Generative Semantics (Chomsky 1973)

- (1) a. John didn't buy many arrows.
  - b. Many arrows weren't bought by John.

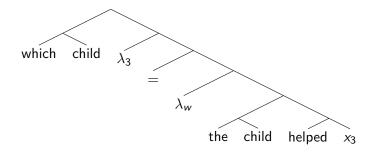

Expectations from Meaning First: start with semantic representation, but which?

(2) Which child did the child help?

Trace theory (Chomksy 1977): 'movement' just a metaphor:

(3) Which child did the child help t?

# Karttunen semantics with plain variables

## The copy/remerge theory

### Chomsky (1995):

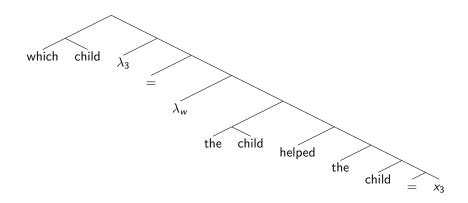

- Movement reuses lexical material
- enumeration indices track lexical items
- (4) Which child did the child help t?
- $\begin{array}{ll} \text{(5)} & \left[\left\langle \mathsf{which},1\right\rangle \left\langle \mathsf{child},1\right\rangle \right] \ \lambda_3 <_{\mathrm{QUESTION},1}\right\rangle \left\langle \mathsf{did},\ 1\right\rangle \left[\left\langle \mathsf{the},\ 1\right\rangle \left\langle \mathsf{child},\ 2\right\rangle \right] \left\langle \mathsf{help},\ 1\right\rangle \left[\left[\left\langle \mathsf{which},\ 1\right\rangle \left\langle \mathsf{child},\ 1\right\rangle \right] \ 3\ \right] \\ \end{array}$

At PF: Pronounce each enumeration item at most once.

At LF, LF 'Trace conversion', ignore enumeration indices otherwise:

- (6) [ $\langle \text{which}, 1 \rangle$   $\langle \text{child}, 1 \rangle$ ]  $\lambda_3 < \text{QUESTION}, 1 \rangle$   $\langle \text{did}, 1 \rangle$  [ $\langle \text{the}, 1 \rangle$   $\langle \text{child}, 2 \rangle$ ]  $\langle \text{help}, 1 \rangle$  [[ $\langle \text{which}, 1 \rangle$   $\langle \text{child}, 1 \rangle$ ]  $x_3$ ]
- (7)  $[[\langle \mathsf{which}, 1 \rangle \ \langle \mathsf{child}, 1 \rangle] \ x_3] \mapsto [\langle \mathsf{the}, \rangle \ [\ \langle \mathsf{child}, 1 \rangle \ [\mathsf{EQUAL-TO} \ x_3]]]$

# Karttunen semantics with copies & variables

# Meaning First View of Movement

#### Goal:

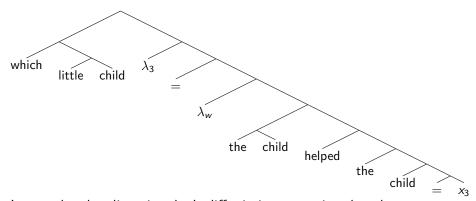

- representational: generate two (or more) independent phrases
- semantic binding as with e.g. pronouns
- semantic incompatibility blocks semantic binding
- spell-out determines linear order and pronunciation

#### Structure of the argument:

- 1 arguments that movement semantics relates two non-identical DPs
- 2 show that spell-out algorithm can be stated

### Late adjunction

No contradiction as long as intersective (Sauerland 2004):

Late and early adjunction don't differ in interpretation though.

## Late Merge in Extraposition

Example: 'Extraposed' adjuncts in English (Fox & Nissenbaum 1999)

(8) I looked for a/\*any picture very intensely by this artist. (a  $\gg$  look for, \*look for  $\gg$  a)

Fox & Nissenbaum's proposal: Unpronounced 'overt' movement of 'a/any picture' followed by insertion of 'by this artist'. (also: Lebeaux 1991, 2009, Sauerland 1998, Fox 2000)

(9) I looked for a picture very intensely a [picture by this artist]

# Fox (2017) – argument 1 for double interpretation

#### Extraposition blocks de re of noun:

- (10) a. John saw an alleged mouse from Mars yesterday.
  - b. # John saw an alleged mouse yesterday from Mars. entailments: there is an alleged mouse x, that alleged mouse is alleged to be from Mars

#### But de dicto of noun available:

(11) John saw an alleged alien yesterday from Mars. entailments: there is an alleged alien x, that alleged alien is alleged to be from Mars

## More evidence for double interpretation

- (20) a. I'll [[explain [a paper that was recommended by a linguist] when we meet] who teaches at UCLA].
  - b. \*I'll [[explain [a paper that wasn't recommended by any linguist] when we meet] who teaches at UCLA].

#### (20)' LF representations for (20) (by local QR + embedded LM)

a. [A paper that was recommended by a linguist who teaches at UCLA].

I'll explain [a paper that was recommended by a linguist]

b. [A paper that wasn't recommended by anyone who teaches at UCLA]
I'll explain [a paper that wasn't recommended by anyone]

#### (20a)" Interpretation of (20a)' (by Trace Conversion)

[A paper that was recommended by a linguist who teaches at UCLA]]  $(\lambda x [I'] = [the_1 paper that was recommended by a linguist]]^{1 \to x})$ 

= [[A paper that was recommended by a linguist who teaches at UCLA]] (λx: x is a paper that was recommended by a linguist. I'll explain x)

#### (20b)" Interpretation of (20)'b (by Trace Conversion)

[A paper that wasn't recommended by anyone who teaches at UCLA]  $(\lambda x [I'll explain [the_1 paper that wasn't recommended by anyone]]^{1 \to x})$ 

= [[A paper that wasn't recommended by anyone who teaches at UCLA]] (λx: x is a paper that wasn't recommended by anyone. I'll explain x)

# Supporting child language evidence

Guasti et al. (2023): Children sometimes overpronounce / undercompress material adults leave silent.

- (12) a. silent antonym markers (Sauerland et al. 2024)
  - b. silent negation with negative indefinites (Nicolae & Yatsushiro 2022, Driemel et al. 2023)
  - c. light null verbs in decomposition (Martin et al. 2022)

Pronounced traces: resumptive noun phrases in children's relative clauses (Ferreira et al. 1976, Labelle 1990 and others):

- (13) el gato empuja al perro que el conejo lava al perro the cat pushes the dog that the rabbit washes the dog
- (14) Ich möchte das Mädchen sein, das der Opa das Mädchen umarmt.
  I want the girl be who the granddad the girl hugs
  I want to be the girl who the granddad hugs. (Yatsushiro & Sauerland 2018)

## Support from Adult resumptive pronouns

Person mismatch with Dinka resumptive  $k\acute{e}(ek)$  (van Urk, 2018):

(15) Wêek cíi Áyèn ké tîiN
2PL PRF.OV Ayen.GEN 3PL see.NF
'You all, Ayan has seen [them].'

Van Urk's proposal: Movement of plural 'you' followed by PF-deletion of 2-nd person features in a chain. (also: Scott 2021, Mendes & Ranero 2021, Georgi & Amaechi 2022)

(16) [SECOND, PL] cii Áyèn [SECOND, PL] tiiN.

### Towards a Full Account

Some critical examples: LF to PF mapping in a late adjunction example:

(17) 
$$\left[ \begin{array}{c|c} \lambda_{x} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} & I & looked for \\ \hline \end{array} \right] \left[ \begin{array}{c|c} \lambda_{y} &$$

I looked for a picture very intensely by this artist.

Pronouns arise in Ruys (1992) QR-out-of-conjunction example:

- (18)  $\lambda_x$  [ a student likes the<sub>x</sub> professor  $\cap$  N and wants the<sub>x</sub> professor to be on his committee ]  $\forall$ [ professor  $\cap$  N ]
  - $\emptyset$  A student likes every professor; and wants her; to be on his committee.

#### A movement

Sauerland (1998), Takahashi & Hulsey (2007): traces of A-movement contain no or almost no restrictor.

(19) A relative of Mary<sub>i</sub>'s seems to her<sub>i</sub>  $\emptyset$  to be in trouble.

$$\exists \ [\mathsf{N} \cap \sqrt{\mathtt{RELATIVE}} \ \mathsf{of} \ \mathsf{Mary's}] \ \lambda_\mathsf{X} \ \mathsf{seems} \ \mathsf{to} \ \mathsf{her} \ \mathsf{to} \ \mathsf{[to} \ \mathsf{be} \ \mathsf{in} \ \mathsf{trouble}.]$$

Total reconstruction for scope:

(20) A woman is likely to win this ultramarathon.

$$\emptyset$$
 is likely to  $\exists$  [N  $\cap \sqrt{\text{WOMAN}}$ ] [to win]

## Basic ideas for English

- (full) chain: All coindexed NPs (i.e. chain links) in a sentence
- 2 argument position: All positions where the sister of the NP is a predicate
- EPP position: Spec(TP) position of finite verbs, raising-to-object position of ECM verbs
- 4 wh-position: Highest position in the left periphery of a question
- subchain: Section of a chain containing one argument position and all c-commanding co-indexed chain links except those c-commanding also higher argument positions.

### **EPP** positions

There expletives: If a chain link is in an EPP position doesn't contain a  $\sqrt{\text{ROOT}}$ , pronounce it as there with the right agreement.

- (21) I expect there to be coffee left.
- (22) You can drink the coffee I expect there to be left.

Total reconstruction: If an EPP position is empty, copy the next lower NP and pronounce it in the EPP position unless it is already pronounced in a wh-position.

- (23) A woman is likely to win this ultra-marathon. (likely  $\gg$  a woman)
- (24) How many women are likely to win this ultra-marathon. (likely  $\gg$  many women)

### Wh-positions

Multiple wh: Pronounce the highest wh-phrase in the left periphery of a question.

(25) Who what Q who ordered what?

Partial reconstruction: Pronounce also predicates in the highest wh-position that only occur in lower chain links.

- (26) Which article about her did no celebrity read?
- (27) which article Q did no celebrity read [article about her]

Maybe extraposed material is exempt from the requirement to be pronounced at the top:

(28) Which picture did you look for very intensely by this artist.

## QR-positions and pronouns

Undo QR as much as possible: Pronounce quantifiers with the right quantificational force in the EPP or else argument position of that subchain such that they are leftmost.

(29) A student likes every professor and wants her to be on his committe. (every professor ≫ a student)

If PP or relative clause modifiers only occur in higher positions, pronounce them there.

(30) I looked for a picture very intensely by this artist.

### Pronouns and elsewhere

Pronouns: If material has not been pronounced in a subchain, but it overlaps with one where it has been pronounced, use a pronoun.

- (31) Which student student called her[student] father?
- (32) every prof A student likes every prof and wants her to ...

Strong crossover: The pronoun will be part of the chain and be the trace in (34).

- (33) \*Which girl did she say [t would win]?
- (34) Which girl t said she would win?

Weak crossover: As in QR, a preference for (36) with pied-piping seems to apply.

- (35) ?? Which girl did her mother say t would win?
- (36) Which girl's mother said she would win?

Elsewhere: Pronounce material still not pronounced in its subchain in an EPP position or else its argument position.

### Locality

Movement binding dependencies: sensitive to island phenomena and require intermediate chain links:

- (37) Who did John read a book that wrote?
- (38) me e gble be wò for t?

  Who you say that he[+wh] hit tWho did you say that -- he hit t? (ewe, Collins 1993, p. 188)

Pronoun binding dependencies: not sensitive to islands, don't allow intermediate chain links

- (39) Who is such that John read a book that she wrote?
- (40) (Who is such that you said that he[-wh] hit her?)

Difference not captured so far.

- relate to non-pronunciation of lower chain links
- relate to semantic minimality (appendix sketch)

### Summary

#### Meaning first view of movement:

- basic assumption: not identical copies, but semantically compatible descriptions
- some evidence for non-identity
- elimination of enumeration indices by use of binding indices, but need chains for pronunciation
- account of locality open

# Minimality

Binding by the closest compatible NP:

- (41) \*A man<sub>1</sub> seems a woman to push  $t_1$ . intended: A man is such that it seems a woman pushes him.
- (42)  $[N \cap \sqrt{\text{MAN}}]$  seems  $[N \cap \sqrt{\text{WOMAN}}]$  to push [N]

Minimization: A proposition is true only of states/models that involve the minimum possible number of entities, i.e. one for the following:

$$[\mathsf{N} \cap \sqrt{\mathtt{woman}}]$$
 to push  $[\mathsf{N}]$ 

In general though minimization makes too strict predictions.

# Contrast Blocking Bound Interpretations

(43) An ox pulled a yak.

Minimization of the following would require a yak-ox pulling itself.

(44) 
$$[N \cap \sqrt{ox}]$$
 pull  $[N \cap \sqrt{YAK}]$ 

Assume: contrast of the two nouns (e.g. exhaustification) adds inferences that block reflexivization.

(45) 
$$[N \cap \sqrt{OX} \cap \neg \Box \sqrt{YAK}]$$
 pull  $[N \cap \sqrt{YAK} \cap \neg \Box \sqrt{OX}]$ 

### Contrast Restricted to Domains

Movement dependencies crossing another nominal require an chain link near the nominal crossed (e.g. van Urk 2018, Keine & Zeijlstra 2024), Dinka:

- (46) Yeyíŋà yé ké tâak, cíi Bôl ké tîŋ who.PL HAB. $2{
  m SG}$  PL think PFV.OV Bol.GEN PL see Who all do you think Bol saw.
- (47) Yeyíŋà yé ké tâak, cíi Bôl ké tîŋ

Note: The matrix subject needs to be contrasted with the trace  $k\acute{e}$  to not bind it.

Proposal: Contrast requires two noun phrase be in a constituent at the intermediate position:
